

ONLINE MEDICAL STORE

Name-shubham Mishra

Registration No-:11715863

Roll no-:RKM012A30

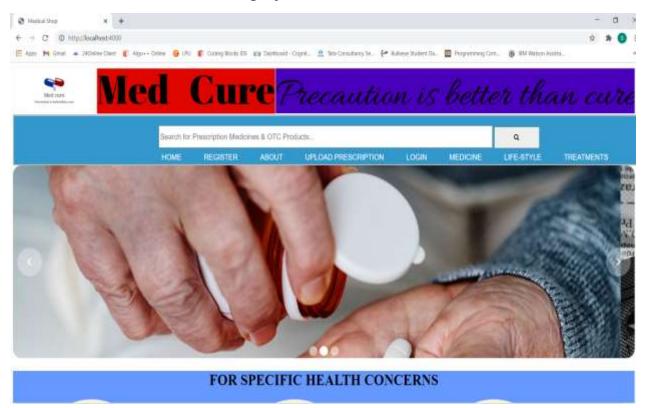

Github link-: https://github.com/shub22mishra/onlinemedicalstore

SUBMITTED TO NEHA SHARMA MA'AM

Objective

The objective of this project is to provide 24 * 7 medical service to all the people. I have done this project using Node, Express & MongoDB. In this project I have provided some features like Upload Prescription, User Registration, Login, Medicine category and so on.

This is the User Interface of the project

Technology used

- I have used **Node.js** For backend such as for routing.
- **Express.js-:** Node.js Web framework.
- **MongoDB-:** For database
- **Nodemon-:** To do Automatic Refresh. With a small change in code it will refresh our server
- **Joi-:** For Validation
- **EJS-:** Embedded JavaScript Templating. It is a view engine
- **Chai/Mocha-:** to perform basic testing using chai, mocha and chai-http, we will add a script that will invoke our test and we will see pass when tests will pass.

SEVER is Running at localhost:4000

```
const express = require("express");
   const session = require("express-session");
   const bodyParser = require("body-parser");
   require("./utils/db.config");
 const MongoStore = require("connect-mongo")(session);
   const mongoDbConnection = require("./utils/db.config");
   const passport = require("passport");
  require("./utils/authStategies/localStrategy");
   const authRoutes = require("./routes/authRoutes");
   const app = express();
app.use(express.static("public"));
   app.use(bodyParser.urlencoded({ extended: false }));
   app.set("view engine", "ejs");
   app.use(
     session({
       secret: "788a154e2a8d07c4cafdee4a7d6dff2d90ab2586",
       resave: false,
       saveUninitialized: true,
       cookie: { secure: false },
       store: new MongoStore({ mongooseConnection: mongoDbConnection }),
```

```
app.use(passport.initialize());
app.use(passport.session());

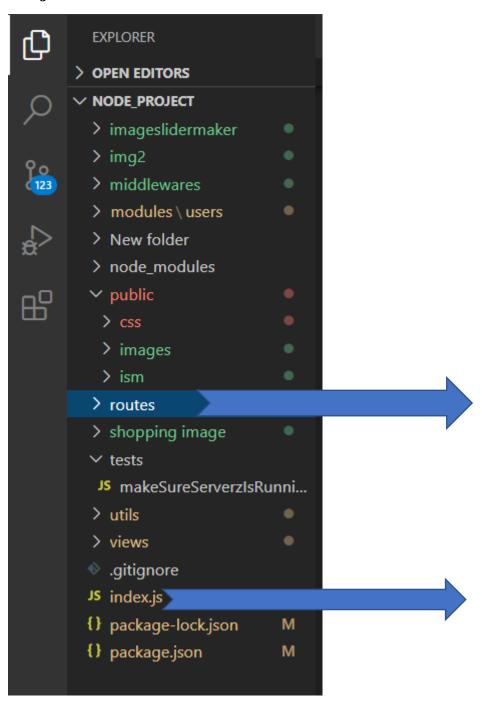

app.use("/", authRoutes);

app.get("/", (req, res) => {
   req.session.views = (req.session.views || 0) + 1
   console.log("User:", req.user);
   return res.render("index");
});

app.listen(4000, () => {
   console.log("Server running at port 4000");
});

module.exports = app;
```

Project file structure

Home page code and screenshots.

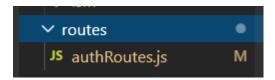

Here I create a view using EJS name as **index.ejs** inside **view** folder.

```
clink rel="stylesheet" type="text/css" href="/css/medical.css" ></link>
           cmeta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
clink rel="stylesheet" href="https://cdnjs.cloudflare.com/ajax/libs/font-awesome/4.7.0/css/font-awesome.min.css"></head>
clink rel="stylesheet" href="ism/css/my-slider.css"/>

(node:13200) DeprecationWarning: collection.ensureIndex is deprecated. Use createIndexes instead.
```

Now inside route Folder I have done the routing

```
const express = require("express");
const router = express.Router();
const { addUser } = require("../modules/users/service/userService");
const {
registerSchema,
} = require("../modules/users/validations/authValidation");
const {
 joiErrorFormatter,
 mongooseErrorFormatter,
} = require(".../utils/validationFormatter");
const passport = require("passport");
* Shows page for user registration
router.get("/register", (req, res) => {
return res.render("register", { message: {}, formData: {}, errors: {} });
});
* Handles user registration
router.post("/register", async (req, res) => {
 try {
   const validationResult = registerSchema.validate(req.body, {
    abortEarly: false,
   });
```

I have performed automated testing using chai/mocha

```
const chal - require("chal");
        const chaiHttp = require("chai-http");
         const app - require("../index");
        chai.use(chaiHttp);
        chai.should();
        describe("Make sure that status is 200", () \Rightarrow { it("should return 200", (done) \Rightarrow (
               .request(app)
    .get("/")
    .end((err, res) => {
                 res.should.have.status(200);
res.body.should.be.a("object");
done();
         \begin{array}{c} {\sf describe("Make sure register fails \ on \ no \ data", \ () \Rightarrow \{ \\ {\sf it("should return 400", \ (done) \Rightarrow \ (} \\ \end{array} 
               .request(app)
               .post("/register")
.end((err, res) => {
PROBLEMS 25 OUTPUT TERMINAL DEBUG CONSOLE

(node:12604) DeprecationWarning: collection.ensureIndex is deprecated. Use createIndexes instead.
```

This code states that the return status should be 200. If it return other than 200. It will throw an error.

2nd Module Registration page

REGISTRATION PAGE

egistration «
address"
over those you areal with argume else
word'
eat Password
heck me out
bmit -

I have created this page using EJS. In this page I have performed Validation using JOI(which is a express middleware for validation).

I have also store all the user detail in Database. I have use MONGODB for the database purpose.

I have also performed password ENCRYPTION for more security purpose. This encrypted password is going to store in database. For encryption I use **node.bcrypt.js**

npm install bcrypt

password: "\$2b\$10\$5cXC8JFg3l1aZwcMZUt30.DcU5EB/OMAdGTepmY2NxZv5h9famrjK"

Here password get encrypted

code and screenshot

```
<div class="form-group">
  <label for="password">Password<sup class="text-danger">*</sup></label>
    type="password"
    name="password"
    class="form-control <%= errors.password ? 'is-invalid' : '' %>"
    id="password"
   required
  <% if (errors.password) { %>
  <div class="invalid-feedback"><%= errors.password[0] %></div>
<div class="form-group">
  <label for="repeat password"</pre>
    >Repeat Password<sup class="text-danger">*</sup></label
    type="password"
    name="repeat_password"
    class="form-control"
    id="repeat_password"
    required
```

```
<%- include('includes/nav'); %>
 <h1>Registration</h1>
  % if (message.type) { %>
   class="alert alert <%= message.type === 'success' ? 'success' : 'danger' %>"
   role="alent'
    <%= message.body %>
  (% ) %>
  cform method="POST" action="/register">
   <div class="form-group">
     <label for="name">Name<sup class="text-danger">*</sup></label>
       type="text"
       class="form-control <%= errors.name ? 'is-invalid' : '' %>"
       id="name"
       name="name"
       value="<%= formData.name %>"
       maxlength="64"
       minlength="2"
       required
```

```
<% if (errors.name) { %>
  <div class="invalid-feedback"><%= errors.name[0] %></div>
  <% } %>
<div class="form-group">
  <label for="email"</pre>
   >Email address<sup class="text-danger">*</sup></label
    type="email"
    class="form-control <%= errors.email ? 'is-invalid' : '' %>"
   id="email"
   name="email"
   aria-describedby="emailHelp"
   value="<%= formData.email %>"
   maxlength="128"
   required
  \sqrt{8} if (errors.email) { %>
  <div class="invalid-feedback"><%= errors.email[0] %></div>
  <% } %>
  <small id="emailHelp" class="form-text text-muted"</pre>
    >We'll never share your email with anyone else.</small
```

FOR VALIDATION

With the help of this code I validate name as well as password.

If user password is not matched with conform password it will throw error

If the detail entered by user is correct

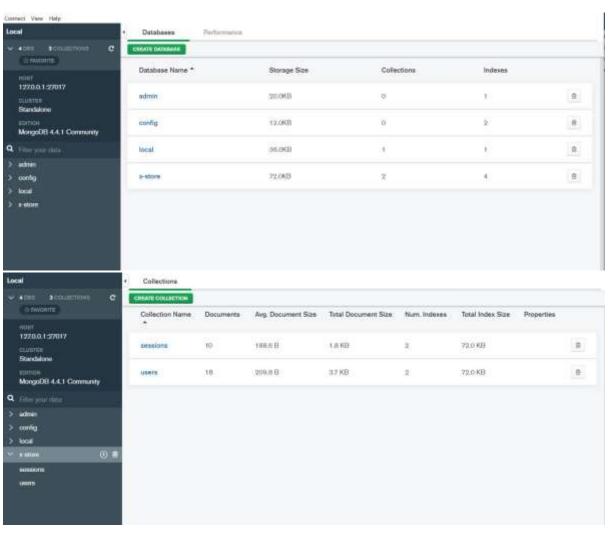

DATA CONNECTIVITY (MONGODB)

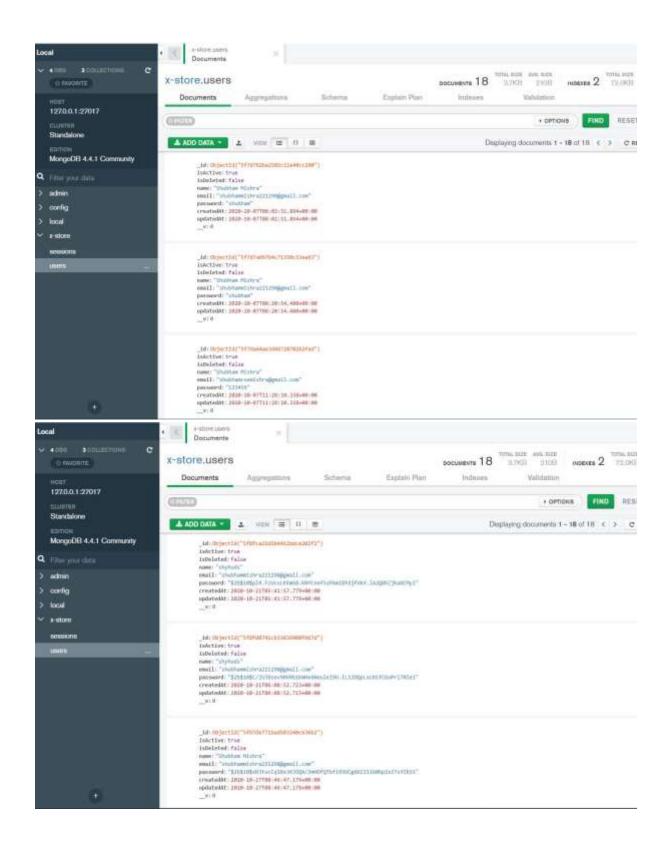

```
utils > Js db.config.js > ...
    const mongoose = require("mongoose");
    mongoose.connect("mongodb://localhost:27017/x-store", {
        useNewUrlParser: true,
        useUnifiedTopology: true,
    });

mongoose.connection.once("open", () => {
        console.log("Connected to MongoDB");
    });

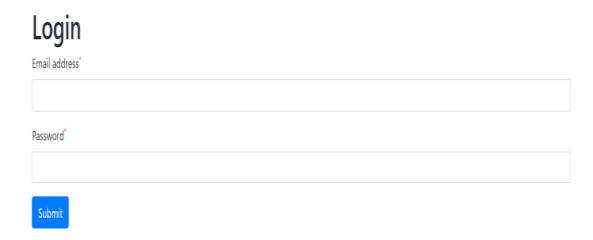

module.exports = mongoose.connection;
```

Data entered by the user is stored in the database named as x-store;

Once the user is successful registered .it will redirected to Login Page

Now there is a product page where user can buy medicine

Code screenshot

After click on buy now it will be redirected to Checkout form

Billing Address & Full Name		Payment Accepted Cards	Accepted Cards		RS 150,00 RS 30,00
